

Your Road to UltraSonic Testing Machines Training

Syllabus – Specialized Training for Automated UT Systems

Specialized training classes are two day, 8 hour, classes that sharpen your UT system operators' skills so that they will be able to increase your inspection productivity and testing reliability.

This is excellent training to be taken after your operating personnel have had time to gain some proficiency with your inspection system. This usually occurs after 3 to 6 months of initial operator experience. It is at this point that the operators have developed a level of experience within which they can form meaningful operational questions built upon actual operating conditions.

Because the operators come to these sessions with a search for answers, they are more engaged in this form of learning than they would be during the introduction and training for their new testing machines.

These short sessions are an excellent way to understand better the relationship between their ultrasonic inspection performance and the material handling principles of your automated inspection system. In addition, by now your operators fully appreciate the necessity for also learning better setup and calibration skills. These classes are structured to share training both in the classroom and on your inspection system.
